CMOS IC

OCTAL TRANSPARENT D-TYPE LATCHES WITH 3-STATE OUTPUTS

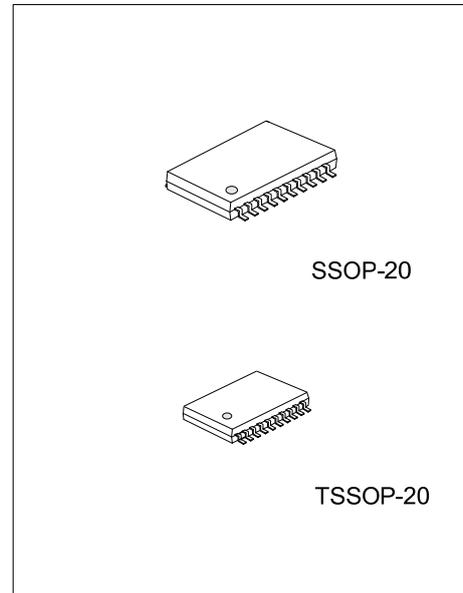

DESCRIPTION

The **U74AHC373** is an octal transparent D-type latch with 3-state outputs, and it has 8 channels.

When the \overline{OE} input is low and the LE input is high, the Q outputs follow the D inputs. When \overline{OE} is low and LE is low, the Q outputs are latched at the logic levels of the D inputs.

When the \overline{OE} input is high, the outputs are in the high-impedance. The \overline{OE} does not affect the internal operations of the latches. Old data can be retained or new data can be entered while the outputs are in the high-impedance state.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pull-up resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

FEATURES
