LINEAR INTEGRATED CIRCUIT

1.0A LOW DROPOUT LINEAR REGULATOR WITH OUTPUT VOLTAGE SETTING OPTIONS

DESCRIPTION

The UTC **LR18943A** is a typical LDO that features output voltage setting options, very low dropout voltage as low as 0.3V at output current 1.0A, an enable input and the soft-start reduces inrush current of the load capacitors and minimizes stress on the input power source during start-up. An enable pin to further reduce power dissipation while shutdown..

The UTC **LR18943A** is stable with any type of output capacitor of 10µF or more. A precision reference and feedback control deliver 2% accuracy.

■ PIN CONFIGURATION

■ PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	V _{IN}	Input voltage. Large bulk capacitance should be placed closely to this pin, A 10uF ceramic capacitor is recommended at this pin
2	V _{PP}	Input voltage for controlling circuit
3	SET1	Output voltage setting pin. Pull-high: 1, Pull-Low; 0
4	SET2	Output voltage setting pin. Pull-high: 1, Pull-Low; 0
5	EN	Enable input. Pulling this pin below 0.4V turns the regulator off, reducing the quiescent current to a fraction of its operating value. The device will be disabled if this pin is left open
6	SSC	Inrush current limit pin
7	ADJ	Resistor ratio of external feedback for output voltage by $V_O=0.8 \cdot (R_1+R_2)/R_2$ Volts
8	V _{OUT}	The power output of the device. A pull low resistance exists when device deactivated by EN pin

External V_O setting:

$$V_O = \{(R1+R2)/R2\} * V_{ADJ}$$

* If ADJ pin is connected to gnd, V_O follows internal V_O setting

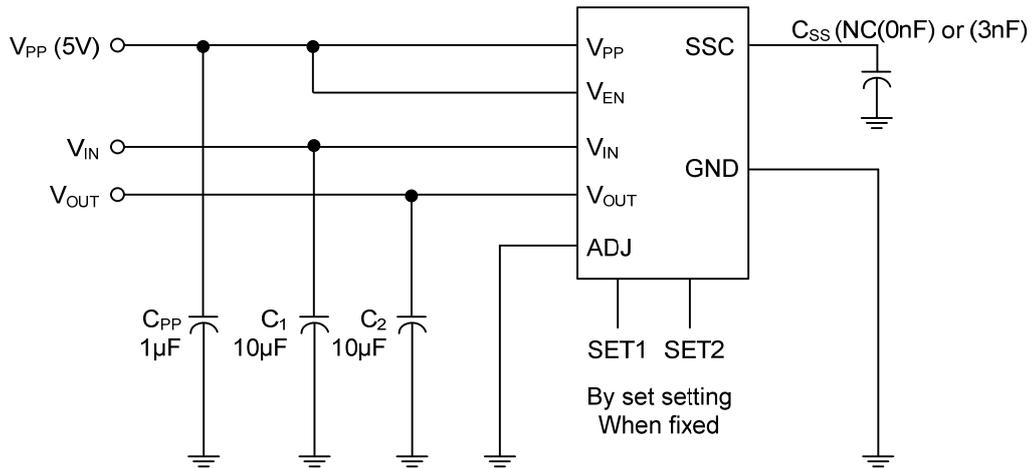

* ADJ pin has the priority than set1 pin and set2 pin

■ TYPICAL APPLICATION CIRCUIT

$$V_{OUT} = \frac{0.8(R1+R2)}{R2} \text{Volts}$$

R2 < 120KΩ is recommended
