

## U74CBTLV3253

Preliminary

CMOS IC

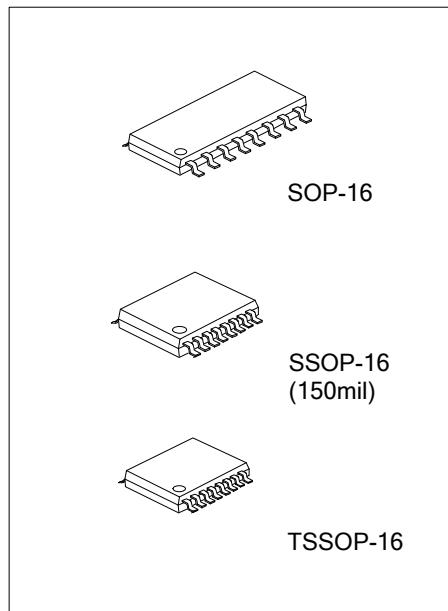

**LOW-VOLTAGE DUAL 1-OF-4  
FET  
MULTIPLEXER/DEMULITPLEXER**

■ DESCRIPTION

The **U74CBTLV3253** device is a dual 1-of-4 high-speed FET multiplexer and demultiplexer. The low ON-state resistance of the switch allows connections to be made with minimal propagation delay.

The select (S0, S1) inputs control the data flow. The FET multiplexers/demultiplexers are disabled when the associated output-enable (OE) input is high.

The **U74CBTLV3253** device is fully specified for partial-power-down applications using I<sub>OFF</sub>. The I<sub>OFF</sub> feature ensures that damaging current will not backflow through the device when it is powered down. The device has isolation during power off.

■ FEATURES

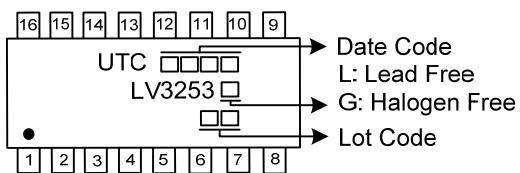

- \* 5Ω Switch Connection Between Two Ports
- \* Rail-to-Rail Switching on Data I/O Ports
- \* I<sub>OFF</sub> Supports Partial-Power-Down Mode Operation

Notes: 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged.

Absolute maximum ratings are stress ratings only and functional device operation is not implied.

2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
